

## 1- Before establishing connection: prerequisites

- Bandwidth: Launch a bandwidth test, for example <http://www.speedtest.net/fr/>.

Now, the best Upload will be the Master.

- Install BetterPushback 0.48 or above (both side) in the plugins folder.

Some parameters must be identical on both sides (Master & Slave).

- AIRAC
- Flight plan in the coroutes folder (.flp)
- “Runway follows the terrain” should be the same “ON” or “OFF” in X plane graphics setting
- Mesh
- Sceneries
- Same location ( gate or runway)
- Same state (C&D, Turn around, ready to fly)
- Same settings in the Preferences tab (winglets, gauges, eyebrow are synchronized)
- Same configuration file: with weather (X Plane weather is send from master to slave) or w/o weather (master and slave use NOAA or FSGRW. Other injectors not tested).

## 2-After connection has been established

- If engines are shut down (C&D or turn around state), they can only be started with the APU.
- Only use trim (nose UP/DN) with your keyboard/joystick and not with the mouse
- Do not blind any axis for the spoilers
- The guards and the landing gear hatch have to be opened/closed by each pilot as they are not synchronized.
- Master only: open the Ground Services tab, and set fuel, payload and CG.
- As usual with any pushback plugin, only the master will drive the tug.
